Project title: Create helper functions and Validation rules for models

Project Value: Ksh. 800

Due date: 9th Feb 2020

Instructions (ONE)

1. On the listing project folder, navigate to app > CustomHelpers > Listing folder

2. Open the ListingFilters.php

3. Fill up the empty functions. Use the filled up function for inspiration.

4. For the last function getListings($filters= []), the filters array can have:

- sortField – e.g name, id etc
- orderBy – ASC or DESC
- date – to filter listings of a specific date
- startDate
- endDate

The idea is to receive an array of attributes and use them to filter the results form the database.

Instruction (TWO)

1. On the listing project folder, navigate to app > Http > Requests

2. The storeAdmin.php file has been completed, use it as an example.

3. For all the other files, you need to create their validation rules(), messages() and attributes().

4. For each file, go to its corresponding migration file to see its attributes. e.g. for StoreUser.php go to app > database > migrations and open the first file to see the attributes. You can decide which attributes are required and which can be nullable.

5. For attributes with more than one word e.g firstName, add them to the attributes function and use human readable format e.g. frirst name. If this attributes are required, add them to the messages() function e.g 'firstName.required' => 'First name is required'.
